Hackathon product brief • Source of truth for product scope and visual design

01

PRD — Product Requirements Document

The north star. What FEMORA builds, for whom, and how success is measured.

Purpose

This document defines the agreed product scope and success criteria for FEMORA. It covers only the PRD and UI/UX design brief; technical stack choices remain undecided. The layout follows the uploaded Vibe Coding guide's PRD template on page 3 and UI/UX template on page 8.

App name	FEMORA
Tagline	Care for every phase of her life.
Product summary	FEMORA is a responsive women's healthcare website that brings together menstrual health, maternity, and perimenopause/menopause support in one platform. It combines user-entered health tracking, health education, safety guidance, personalized explanations, appointments/reminders, and doctor-ready reports.
Problem	Women's health information and tracking needs change across life stages. Users may have to manage symptoms, records, appointments, and educational resources in separate places. FEMORA provides one coherent place to record relevant information, understand recorded patterns, find reviewed education, and prepare for conversations with healthcare professionals.
Target users	Women seeking information and practical tracking support across menstrual health, pregnancy and postpartum recovery, perimenopause, menopause, and postmenopause. Users may activate more than one relevant journey; FEMORA must not infer a user's stage from age alone.
Core value proposition	A life-stage-aware women's health platform that brings tracking, education, safety pathways, and user-controlled health summaries together without claiming to diagnose.
Product principles	1) Education and tracking, not diagnosis. 2) Safety rules take priority over AI. 3) Sensitive questions are asked only when relevant, optional where possible, and accompanied by an explanation. 4) Users control their health information and report sharing. 5) Preserve records when journeys change. 6) Clearly distinguish real records, sample data, and simulated features.

Core features — Must-have	• Public landing page with FEMORA logo/tagline, About FEMORA, How It Works, privacy reassurance, Get Started, footer/contact/FAQs. • Registration/demo entry, login flow for the prototype, onboarding, journey selection, profile/preferences, and protected personal-health areas. • Three health journeys with functional core workflows: Menstrual Health, Maternity (pregnancy and postpartum), and Perimenopause/Menopause/Postmenopause. • User-entered check-ins and health records, with clear validation, saved-record views, and a combined chronological timeline labelled by journey. • Rule-based safety guidance and flags that cannot be overridden by AI; safety guidance remains available if AI/backend features fail. • AI-supported explanations of recorded patterns, personalized education, record summaries, and suggested next steps without diagnosis; responses grounded in credible medical sources and reviewed FEMORA content, with fallback to static content/rule-based insights. • Sexual Wellbeing area within the Menstrual Health journey, including the previously agreed features, FAQs, and glossary; optional/private, with separate visibility controls where technically supported. • Health education library with search/browse, journey categories, credible references, bookmarks, recently viewed topics, and journey-relevant recommendations. • Appointments and notes, calendar view, user-selected reminders, and in-app notifications. • Separate journey reports for Menstrual Health, Maternity, and Menopause, with on-screen preview and downloadable PDF; user initiates any sharing. • Privacy controls: view/edit personal and health information, notification preferences, privacy/consent choices, health-data download, account-deletion request, and individual-record deletion where supported. • Light/dark themes with manual switching and optional system default; responsive, accessible layouts. • Public HTTPS deployment, demo account for judges plus registration option, shared repository, setup/deployment README, feature-status checklist, architecture/data-flow overview, environment configuration guide, and testing/known-limitations checklist.
Should-have	• Polished guided demo experience and richer empty/loading/error states beyond the minimum needed for reliable workflows. • Broader automation of recurring reminders and more complete calendar interactions, subject to implementation time. • Expanded report customization and additional filtering across the health timeline. • Additional educational content and richer personalization after the core reviewed content is stable.
Future enhancements	• Production-grade authentication and account lifecycle beyond the simplified hackathon demo login. • More complete persistent database integration if the initial prototype uses temporary demo data/browser storage. • Expanded language support beyond English. • Further clinical review, usability studies, security hardening, and production-readiness work before real-world launch.
Out of scope for this version	• Automated diagnosis, treatment decisions, or AI determining clinical urgency. • AI replacing a qualified healthcare professional or overriding predefined safety guidance. • Automatic sharing of reports or records with providers; sharing must be initiated by the user. • Assuming a health stage based on age or silently merging data across journeys. • Claiming that a simulated feature or sample record is a functional feature or real user record. • Immediate production-ready public healthcare launch without further testing, clinical review, and security work.
Key user stories	• As a new visitor, I want to understand FEMORA and its privacy approach before creating an account, so that I can decide whether to continue. • As a user, I want to choose one or more health journeys and complete only relevant profile questions, so that the experience fits my needs. • As a user, I want to log symptoms and lifestyle information, so that I can review my own history and recorded patterns. • As a user, I want clear safety guidance when I report a potentially serious symptom, so that urgent guidance is not hidden behind AI or a questionnaire. • As a user, I want AI explanations grounded in reviewed health content, so that I can better understand my records without receiving a diagnosis. • As a user, I want to create and preview a report before downloading it, so that I can decide what to share with a healthcare professional. • As a user, I want to switch or add journeys without losing earlier records, so that my history remains intact. • As a user, I want to review, download, and manage my health data, so that I retain control over sensitive information.

Success metrics / definition of done	• Judges can complete the main journey without assistance. • All three journeys have working core workflows. • Predefined safety scenarios show the expected rule-based guidance; AI does not override safety rules. • AI responses use reviewed FEMORA content/credible references and fallback behaviour works when the service is unavailable. • Reports preview and download correctly from available saved records. • Manual checklist testing passes for every critical user flow; validation errors preserve entered data where possible. • Privacy checks confirm user records are separated, private health information is not exposed on public pages, and report sharing requires deliberate user action. • Desktop and mobile key flows work; tablet layout receives a basic check. • All user-facing medical education and safety messages are checked against credible sources before release; any pending review is clearly flagged. • Sample data and simulated features are clearly labelled. Technical errors are user-friendly; logs exclude sensitive health data and credentials.
Analytics and feedback	Collect minimal, privacy-conscious operational analytics (such as feature usage and error rates) without sensitive health details. Explain analytics clearly and provide a choice where applicable. Offer an optional usability/helpfulness feedback form that does not require health details.
Data and consent	Explain privacy during registration and request relevant consent when personal health features are first used. Sensitive questions are asked only when relevant, optional where possible, and explained. In-app notifications only. Account deletion explains consequences and requires explicit confirmation, following a documented process.
Demo and delivery constraints	Target a working end-to-end product within the 36-hour hackathon. Use synthetic data for demo accounts and real user-entered data for actual use with appropriate consent. Temporary demo data/browser storage is acceptable if database integration is infeasible, but its limitations must be disclosed. The technical stack is intentionally undecided and must not be silently assumed.

04

UI/UX Design Brief — Visual & Interaction Design Guide

So FEMORA feels consistent, reassuring, accessible, and recognizable across every health journey.

Design intent

This brief captures the previously agreed Sage Rose visual direction, supplied FEMORA identity/design references, responsive requirements, accessibility requirements, and health-specific interaction rules. It does not introduce a new brand or invent missing palette values.

Aesthetic direction	Sage Rose: calm, reassuring, warm, botanical, modern, and healthcare-appropriate. Follow the previously supplied FEMORA logo and design references closely, including botanical elements and layout cues. Avoid a generic hospital dashboard or overly clinical visual tone.
Brand identity	Product name: FEMORA. Tagline: “Care for every phase of her life.” Use the approved logo and botanical motifs consistently. Do not redraw or replace the brand mark without approval.
Color palette	Use the established Sage Rose palette from the supplied design references. Exact HEX values are not specified in the retained decisions; sample the approved reference assets rather than inventing new brand colors. Maintain sufficient contrast in both light and dark themes.
Typography	Use a readable, accessible type system with clear hierarchy: prominent page headings, concise section headings, readable body text, and comfortable line spacing. Support adjustable text size. Final font family should be selected during implementation to match the references and remain readable.
Light and dark modes	Provide both light and dark themes, a manual theme switch, and an optional system-default setting. Check color contrast and component states independently in both modes.
Layout and responsiveness	Responsive website for desktop, tablet, and mobile. Use consistent spacing, clear page hierarchy, and layouts that adapt without hiding critical health or safety information. On small screens, simplify navigation and use touch-friendly controls.
Navigation patterns	Main navigation architecture is not yet finalized. Support a unified overview plus separate dashboards when multiple journeys are active. Use clear active-journey context and adaptive journey navigation. Suggested journey navigation may include Home, Check-in, Insights/Report, Learn, and relevant appointments/reminders; confirm final navigation during implementation.
Page patterns	Use clear dashboard summaries, symptom/check-in forms, timelines, insight cards, educational article views, appointment/calendar views, report preview screens, profile/settings pages, and consent/privacy screens. Keep the main action on each page visually obvious.
Components	Use consistent cards, form fields, buttons, tabs/navigation, badges for meaningful statuses, modals/confirmation dialogs, date inputs, charts/timelines, empty states, loading states, and error messages. Keep corner radii and shadows consistent with the supplied reference style; use subtle elevation rather than heavy shadows.
Health data visualization	Use clear labels, dates, units where relevant, and plain-language explanations. Do not rely on color alone to communicate health status. Show uncertainty labels for period predictions and avoid implying predictions are certain.
AI and safety UI	Label AI-generated explanations clearly. Present predefined safety guidance first for potentially serious symptoms; never make it dependent on AI availability. Provide concise, actionable language and direct users to appropriate professional/emergency care when the reviewed guidance calls for it.

Sexual Wellbeing UI	Keep Sexual Wellbeing optional and privacy-sensitive. Preserve the previously agreed features alongside the supplied FAQs and glossary; FAQs must not replace the other features. Provide separate visibility controls where technically supported, and do not save educational browsing answers unless the user chooses to save them, where that behaviour is supported.
Forms and onboarding	Ask common profile questions first and journey-specific questions next. Explain why sensitive information is requested, make it optional wherever possible, and collect only what a feature needs. Preserve entered values when validation fails. Make saving and consent actions explicit.
Reports and sharing	Provide a report preview before PDF download. Users must take explicit action to download or share; no automatic provider sharing. Clearly label the journey and date range covered by each report.
Accessibility	Support keyboard navigation, visible keyboard focus, accessible labels/instructions, screen-reader-friendly structure and controls, readable typography/adjustable text size, clear validation messages, sufficient contrast in light/dark themes, and status communication that does not depend on color alone.
Reference and implementation guardrails	Use the user-supplied FEMORA logo, Sage Rose palette, botanical elements, and UI references as the visual source of truth. Do not introduce unrelated redesigns or extra product modules. If exact colors, font names, or final navigation details are not present in the reference materials, leave them for confirmation instead of inventing them.
